HUGPONG

HUGPONG USER MANUAL

Step-by-step use of the Web Management Console and Android application

Document control	Current edition
Edition / baseline	1.1 / Beta 1.0.8
Reviewed	28 October 2026 (Asia/Manila)
Coverage	Web Management Console and Android application
Format	Times New Roman, 12 point; black and white

For Farm Members, Farm Managers, SRA Admins and Super Admins. Instructions distinguish connected management tasks from supported Mobile offline owner work.

Start with accounts and navigation, then the chapter for your role. Use the reporting, analytics, synchronization and troubleshooting chapters when needed. The separate System Guide explains why the workflows and calculations behave this way.

Official HUGPONG website

https://hugpong-beta.onrender.com

Keep passwords, OTP codes, private keys and recovery passphrases out of shared training notes and beta reports.

1. About HUGPONG

HUGPONG supports sugarcane field operations and regulatory oversight for block farms in Silay City. It connects field recording, crop planning, costs, farm supervision, monthly audit reports, and SRA price references.

The Web Management Console provides management and administration tools. The Android application supports Farm Members, Farm Managers, and SRA Admins, including selected offline workflows.

How records become official

The HUGPONG server checks permissions and validates changes before saving official records in the shared database. A saved draft, cached screen, or unsynchronized change on a phone is local work. It becomes a shared record only after the server accepts it.

Keep these distinctions in mind:

- Draft: editable preparation for an operation; it has not been submitted.
- Unsynced: a change is saved locally and is waiting for server acceptance.
- Active operation: a submitted record in the current operational history.
- Archived operation: a retained historical record.
- Certified audit: a report that an SRA Admin has reviewed and certified.

Farm Managers monitor and compile operation records. They do not approve or certify individual operation logs. SRA certification applies to an audit report.

Reading this manual

The instructions use English interface labels. Android also offers Hiligaynon and Filipino. Some labels change with the selected language. Buttons and data depend on your role, assignments, connection, and installed version. Use the screen's explicit Close, Cancel, or back control to leave a dialog.

2. Roles and available tools

Role	Web console	Android app	Main responsibility
Farm Member	No member workspace	Yes	Plan and record work for assigned fields
Farm Manager	Yes	Yes	Supervise an assigned block farm, manage fields and members, and compile monthly audits

Role	Web console	Android app	Main responsibility
SRA Admin	Yes	Yes	Review and certify audits, publish price references, and oversee farms
Super Admin	Yes	No	Govern accounts, support, diagnostics, and backup/recovery

What each role can do

Farm Member: view assigned fields; prepare plans and drafts; record operations; view authorized operation history and analytics; request a new crop cycle; manage personal settings; and submit support tickets.

Farm Manager: manage fields and Farm Members within the assigned farm; monitor work and synchronization; record work on another owner's field through authorized Manager Takeover; compile and deliver monthly audits; and review cycle-renewal requests.

SRA Admin: inspect farm information; review, return, or certify monthly audits; verify audit QR references; compile certified reports by crop year; publish price references; and perform permitted account provisioning and verification reviews. Farm Member directory entries may be read-only for this role.

Super Admin: administer permitted accounts and roles; handle support tickets; inspect the system audit ledger and diagnostics; monitor synchronization; and manage encrypted business-data backups. SRA professional certification remains an SRA Admin function.

Access to a menu does not grant access to every record. Farm and field assignments determine which data you can use.

3. Getting started

Before your first session

Have the following ready:

- The official HUGPONG website address or Android installer supplied by your organization.
- Your permanent eight-digit User ID or registered Philippine mobile number.
- Your password, or the initial password provided by an authorized administrator.
- A working connection for sign-in, verification, and initial data loading.
- Your correct farm and field assignment, if already arranged.

Open the web console

1. Open your organization's HUGPONG website in a current browser.
2. Select its sign-in or management-console entry.
3. Sign in with an account that supports web access.
4. Complete any verification or first-login password prompts.
5. Confirm that the displayed name, role, and farm assignment are correct.

On a narrow browser window, use the menu button to open navigation.

Install and open Android

1. Download the official Android APK using your organization's HUGPONG download page.
2. Open the downloaded file. If Android asks, allow installation from the source you used, then follow the installation prompts.
3. Open HUGPONG and choose Hiligaynon, Filipino, or English.
4. Complete the introduction and sign in or register as a Farm Member.
5. Respond to the notification-permission prompt. Notifications support reminders and recovery-request alerts.
6. Allow camera access when you use the QR scanner. Photo access is requested when selecting an image containing an audit QR code.

When updating, install the official update over the existing installation. Synchronize pending work first. Uninstalling the app or clearing its storage can remove drafts and unsynchronized work.

4. Accounts, sign-in, and recovery

4.1 Register as a Farm Member on Android

1. On the sign-in screen, open Register or the account-creation option.
2. Enter your official name, including the required first and last names.
3. Select your Block Farm if known. You can continue unassigned where the form permits it.
4. Enter your registered Philippine mobile number in the displayed format, such as 09XXXXXXXXX.
5. Choose an available phone-verification method. For SMS, request the code and enter the six digits. Otherwise, request authorized phone-verification review.

6. Create and confirm a password, review the privacy and terms notices, and accept the required consent.
7. Submit the form once and wait for the result.
8. Save the permanent eight-digit User ID shown on the success screen, including any leading zeroes.
9. Follow any remaining review or assignment instructions. Contact your Farm Manager if your field is not available.

Self-registration is for Farm Members. Farm Manager, SRA Admin, and Super Admin accounts are created through authorized administration workflows.

4.2 Sign in and complete first-login setup

1. Enter your eight-digit User ID or registered mobile number and your password.
2. Complete any required consent prompt and select the sign-in button.
3. If phone verification is required, choose SMS or authorized review as offered.
4. If prompted to change an initial password, create and confirm your own password.
5. Wait until HUGPONG opens your role's workspace.

Passwords must contain 8 to 256 characters, including an uppercase letter, a lowercase letter, and a number. Common or predictable passwords are rejected.

The interface currently directs Smart and TNT users to authorized review when SMS verification is unavailable. Follow the options shown by the application. An authorized reviewer must verify the registered number before clearing a review requirement.

Repeated failed sign-in attempts can temporarily lock the account. Wait and follow the displayed message; restarting the app or refreshing the page does not clear the server's lockout.

4.3 Reset a forgotten password

When SMS recovery is available:

1. Select Forgot Password from sign-in.
2. Enter the identity details requested by the form.
3. Request and enter the SMS code.
4. Create and confirm your new password.
5. Return to sign-in and use the new password.

When authorized recovery review is needed:

1. Open password recovery and choose the authorized-review option.

2. Enter your permanent User ID and registered mobile number.
3. Submit the request and arrange an identity check with an authorized Farm Manager, SRA Admin, or Super Admin, as appropriate to your account.
4. Keep the recovery screen available for status updates. Android may also notify you if notification permission is enabled.
5. After approval, set your own new password within the 15-minute approval window.
6. If the request is rejected or expires, read the explanation and start a new request when ready.

The reviewer authorizes recovery; you create the new password yourself. Phone-verification review and forgotten-password recovery are separate processes.

5. Navigating web and mobile

Web navigation

Use the left sidebar for workspaces and the account menu for settings, support where available, and sign-out.

Role	Main sidebar destinations
Farm Manager	Dashboard; Farm & Field Registry; Field Operations; Operational Analytics; Sync Monitor; User Management
SRA Admin	Dashboard; SRA Audit Center; SRA Price Monitor; Operational Analytics; Farm & Field Registry; User Management
Super Admin	Dashboard; User Directory Monitor; System Sync Monitor; Support & Tickets Desk; Maintenance & Security; Diagnostics Console; Backup & Recovery

Android navigation

The main tabs are Home, Planner, Field Ops, and Profile, subject to role and connection. SRA Admins use Field Ops as the Audit Desk and do not have the Planner tab. Analytics and Sync Monitor open from the relevant dashboard or screen controls.

Mobile uses a shared font scale across all tabs, with secondary text at least 14 points and darker supporting text. Your phone's font-size setting also applies; longer descriptions can wrap to additional lines.

For Farm Members and Farm Managers, offline navigation emphasizes field work. Some Home, Profile, and management controls are unavailable until connectivity returns. Farm Member planning remains available within the supported offline navigation.

Filters and detail views

- Select the correct Block Farm and Field before reviewing or entering data.
- Treat Crop Year Cycle and Field as separate filters.
- Open a record to inspect its operation date, costs, author, amendments, and synchronization state.
- Use Load More or the available paging control to inspect additional records.
- An empty filtered view can mean no matching data; it does not necessarily mean records are missing.

6. Farm Member: plan and record work

6.1 Check your field

1. Sign in on Android and open Home or Field Ops.
2. Select your assigned field.
3. Check its owner, area in hectares, Crop Year Cycle, and Current Stage.
4. Contact your Farm Manager if the assignment or area is incorrect. Do not use another person's field to record your work.

If no field appears, your account may still need assignment. A newly registered account does not create a field automatically.

6.2 Prepare a plan

1. Open Planner and choose your own field.
2. Confirm the current crop stage and choose an offered catalogue operation, or use a permitted custom operation.
3. Choose the calendar date and enter estimated labor, material, and other costs, with any useful notes.
4. Review the estimated total and schedule date shown by the planner.
5. Save the schedule. Select its operation-input action when you are ready to record the actual work.

6. Review the operation form opened in Field Ops. Save a draft or submit the actual operation there. Opening this form from Planner does not automatically create a draft or submitted operation.

A plan is an estimate. It does not prove that field work happened and does not become a submitted operation until you record and submit the actual work. Reminder delivery depends on the device's notification permission and settings.

The calendar-selected date is carried into the operation form opened from Planner and is read-only there. If it does not match the actual work date, correct the schedule/calendar selection before recording that work.

6.3 Save a draft

1. Open Field Ops, select your field, and open the relevant operation or add-operation action.
2. Enter the work details you know.
3. Select the draft-saving action and confirm it.
4. Reopen the draft later and complete or correct its details before submission.

Drafts remain local preparation. You can discard a draft, but you cannot permanently delete a submitted operation through the normal record workflow.

6.4 Record completed work

1. In Field Ops, choose the correct field, stage, and operation.
2. Enter the Operation Date: the date the activity was performed.
3. Fill in the required quantity, unit, rate, area, labor, material, or line-item details shown for that operation.
4. For planting, choose the sugarcane variety when required. The variety is associated with that Crop Year Cycle.
5. Check every line item and the calculated total. Record actual quantities and actual costs.
6. Select the submission action and review its confirmation. If submitting a batch, inspect each included draft first.
7. Read the result: Synced means the server accepted it; Unsynced means it remains on the device awaiting synchronization.
8. Open the ledger or history and verify the operation, date, field, and total.

Example: If a form uses quantity multiplied by rate, three units at PHP 500 per unit total PHP 1,500. Check that the selected unit represents the real activity before submitting.

Use the existing saved entry if the connection drops. Check its synchronization state before attempting another submission.

6.5 Additional work and stage completion

Use a Supplemental entry, where offered, to record additional work against an already completed task. It is a separate activity record, not a replacement for the original operation.

After all required activities in a stage are complete, use the stage-completion or next-stage control and review any warning about missing work. An offline stage change stays provisional until the server accepts it.

7. Farm Manager: farms, fields, and users

Block Farm setup by an authorized SRA Admin

Before field enrollment, an authorized SRA Admin can create or update a Block Farm through the web Farm & Field Registry:

1. Open the Block Farm create or edit action.
2. Enter the farm name, address, and declared area in hectares.
3. Select an available Farm Manager, or leave the assignment empty if permitted.
4. Save online and verify the returned farm details and permanent ID.
5. Confirm the manager assignment before asking that manager to enroll fields.

The Android app does not provide Block Farm creation. Use web for this setup; both clients use the saved farm and assignment afterward.

7.1 Start the day

1. Open Dashboard on web or Home on Android.
2. Confirm your assigned Block Farm.
3. Review field counts, area, crop progress, recent operations, and attention items.
4. Open Sync Monitor to investigate unsynchronized work or outdated member activity.
5. Follow up with the relevant member before compiling reports that depend on that work.

Activity and successful synchronization are different measures. Recent sign-in activity does not prove all field changes have reached the server.

7.2 Enroll a field

Web: open Farm & Field Registry and choose Enroll New Field Plot. Android: open the field-management/enrollment action available in Field Ops.

1. Connect to the server. New field enrollment requires an online response.
2. Confirm the Parent Block Farm.
3. Choose the Assigned Field Owner, or leave it unassigned if permitted.
4. Enter the Plot Area in hectares. It must fit the Block Farm's remaining area.
5. Review and submit the form.
6. Wait for the permanent Field Plot ID and Crop Year Cycle to be returned.
7. Reopen the field and verify the area, assignment, and cycle.

Field IDs, Block Farm IDs, and internal cycle IDs are system-generated. The enrollment cycle preview is read-only; the server sets the official value.

For an existing field, use its edit action to update permitted details. Read an archive confirmation carefully: field archival and operation-history viewing are different actions.

7.3 Provision and review Farm Member accounts

Web: open User Management. Android: use the user-management, provisioning, or pending-review controls in Field Ops.

1. Choose the relevant create or review action.
2. Enter or verify the person's name, registered number, permitted role, and farm assignment.
3. Complete the verification method required by the form. Document an authorized manual phone check using the offered reason and details.
4. Save the account or review decision and wait for server confirmation.
5. Give the account holder the permanent User ID and any initial credentials through your organization's normal process.
6. Arrange the correct field assignment and ask the member to complete first-login setup.

Farm Managers provision Farm Members within their allowed scope. SRA Admins and Super Admins have different account permissions. If an action is absent or a row says read-only, use the appropriately authorized administrator.

7.4 Use Manager Takeover

1. Open the member's field in Field Operations on web or Field Ops on Android.
2. Select Manager Takeover or its authorization action.

3. Enter your own account password while connected to the server.
4. Wait for authorization for that specific field.
5. Record or amend the permitted operation and review the result.

Takeover authorization is time-limited, normally five minutes in this release. Reauthorize if it expires or you switch to a different field. Both authorization and takeover work require a live connection; a previously authorized takeover does not become an offline permission. The system preserves the manager's identity and Manager Takeover provenance. A takeover entry is distinct from an amendment. Planning and drafts are available to the field owner; takeover does not transfer ownership.

The authorization summary identifies the selected plot, owner, area, Block Farm, and Current Stage. A farm ID displayed instead of a name means the name is not currently available; it does not by itself mean the assignment is missing. Report a persistent incorrect assignment to your administrator rather than changing another field's records.

8. Crop stages and cycle renewal

The six stages

Order	Current Stage
1	Land Preparation
2	Planting
3	Basal
4	Weeding
5	Top-Dress
6	Harvest

Record operations against the appropriate activity and stage. Follow the current-stage controls and any missing-work warnings. Keep the Operation Date accurate even when entering work later.

Request and approve a new Crop Year Cycle

Cycle renewal uses an online request and review process.

1. The field owner finishes recording and synchronizing the previous cycle's work.

2. The owner opens the field's new-cycle or renewal action and reviews the selected cycle type. A manager acting for another owner needs valid Manager Takeover authorization.
3. Submit the request while connected. The application confirms that the request was sent; this does not mean the new cycle has started.
4. The field's operations are locked while the request is pending.
5. The Farm Manager compiles all outstanding submitted operations and reviews the pending renewal request.
6. The manager approves or rejects the request using the review controls. If approval is blocked, resolve the outstanding compilation requirement first.
7. After approval, confirm that the previous cycle is closed, its operation history is archived, and the next cycle is active at Land Preparation.

Historical operations remain available under their previous Crop Year Cycle. A request is not a way to erase an inaccurate record. Resolve a correction through the appropriate amendment process before closure.

9. Operations, corrections, and archives

9.1 Read a record

Open the record details to check the Field, Crop Year Cycle, Operation Date, operation type, quantities, costs, recorded-by identity, and history.

Label	Meaning
Active	Submitted operation retained in the active lifecycle
Archived	Historical operation retained after archival
Supplemental	Additional work recorded separately
Manager Takeover	Entry recorded through authorized manager supervision
Amended	The record has a correction history
Synced / Unsynced	Whether a local change has received server acceptance

Several labels can appear together. For example, an Active operation can be Supplemental, have Manager Takeover provenance, and have amendments. These labels describe different properties.

9.2 Correct an eligible operation

1. Open the operation and choose its edit or amendment action, if available.
2. Confirm your authorization. Managers editing another owner's field need valid Takeover authorization.
3. Change the inaccurate values.
4. Enter a meaningful Reason for Amendment.
5. Review and submit the correction.
6. Check the record's amendment history and synchronization result.

The original authorship and amendment trail are retained. Archived operations and records protected by the audit workflow may be locked. If no correction action is available, contact the Farm Manager or relevant SRA reviewer; do not create a duplicate to hide the mistake.

9.3 Review archived records

Web: use the history/archive controls in Field Operations. Android: open the ledger, history, or archive view in Field Ops.

1. Select the Crop Year Cycle.
2. Filter by Field and operation type where needed.
3. Use exact record-ID search when offered, and load additional pages as necessary.
4. Open the matching record to inspect its stored details.

Clear View hides the currently displayed results. Show Records restores the view from its first page. Neither action deletes records. Submitted operation records follow Active -> Archived and are retained.

10. Monthly audits and QR verification

10.1 Understand the audit states

State	What it means	Next responsible action
Compiled	A report snapshot has been prepared	Manager chooses a delivery method
Pending Submission	Delivery is waiting for synchronization	Manager restores connectivity and checks delivery

State	What it means	Next responsible action
Pending Review	Report is in the SRA review workflow	SRA Admin reviews it
Returned	SRA reviewer requested corrections	Manager reads the reason and recompiles after correction
Certified	SRA Admin certified the report	View the preserved certified snapshot or export it

Compiling, delivering, importing, and certifying are separate actions. Generating or scanning a QR code does not certify a report.

10.2 Farm Manager: compile and deliver

Web: open Field Operations and its monthly audit compilation action. Android: use the monthly compilation action in Field Ops.

1. Synchronize the relevant field operations for your assigned Block Farm and reporting period.
2. Review the proposed month. The system prioritizes unresolved reporting work; follow the period offered and any validation message.
3. Open the server-generated member review. Review members with no monthly records and account-activity attention items. Calling a member is optional and opens your phone application; it does not automatically mark the member contacted or verified.
4. Select Compile Available Operations to continue. Opening the member review alone does not create a report. A plot without recorded work does not block compilation. At least one eligible synchronized operation is required, and only included fields contribute to reported coverage.
5. Review the report ID, farm, month, version, fields, operation count, area, and costs.
6. Select Send Through Cloud or Generate QR Transfer.
7. For Cloud delivery, wait for server confirmation that the report is awaiting SRA review. A queued delivery is still waiting to be sent.
8. For QR delivery, display or save the QR image and give it to the SRA reviewer through the organization's reporting process.
9. Reopen the report to check its status and any return reason.

Current QR codes contain a compact report reference and integrity information. The server retrieves and verifies the full report. They are not standalone offline copies of all operations. If the report was prepared locally, ensure the canonical report has reached the server before expecting the reference to resolve.

Starting official monthly compilation requires an online readiness check. Android can retain supported pending delivery work, but the report is official only after server acceptance. Unsynchronized operations for the selected farm and period must be resolved first. Do not treat a pending delivery as a report already received by SRA.

10.3 SRA Admin: open and verify a report

Web: open SRA Audit Center. Android: open the SRA Audit Desk in Field Ops.

1. Select a report in Audit Inbox, or open the QR verification tools.
2. Scan the manager's QR code, choose a QR image when offered, or use the online report-ID lookup.
3. Wait for the server to retrieve and verify the report.
4. Review its farm, month, manager/compiler, fields, operation snapshots, costs, version, and integrity result.
5. If an import confirmation is offered, confirm it only after reviewing the report. Import places it in the review workflow; certification is a separate decision.

Android can retain a reference scanned while offline and retry when the server is available. Final lookup/verification of current reference QR codes requires connectivity. Older QR formats may remain readable, but server confirmation is still required for official actions.

10.4 Certify or return

1. Open a Pending Review report while connected.
2. Inspect its contents and supporting operation snapshots.
3. If correct, choose the certification action and confirm it.
4. If corrections are needed, choose the return action and provide a clear reason.
5. Wait for server confirmation and verify the resulting status.

A returned report remains in history. The manager corrects eligible source records and recompiles as a new linked version, then sends that version for review. Certified versions preserve their recorded snapshot and certification identity. Certification does not change source operation lifecycle labels to a new approval state.

10.5 History, certificates, and crop-year compilations

Open Audit History to review certified monthly snapshots and their certification details. Use the print, PDF, or share control offered for the certified report. On web, the browser print dialog can save a PDF; Android uses its export/share flow.

To compile certified reports by Crop Year Cycle as an SRA Admin:

1. On web, open SRA Audit Center -> Crop Year Compilations. On Android, use the calendar control in the Audit Desk or Crop Year Compilations from Monthly Audit History.
2. Select the Crop Year Cycle and All Block Farms or one Block Farm.
3. Review the online preview, including covered months, source reports, unique operations, fields, members, hectares, and costs.
4. Choose Compile Crop Year and wait for the saved result.
5. Open a saved compilation and use Print / Save PDF on web or Export / Share PDF on Android.

These compilations cover certified reports to date. They do not declare the crop year complete or replace monthly certification. They require a live connection, and older saved compilations remain unchanged when later monthly reports are certified.

11. SRA prices and analytics

11.1 Read price references

Use the price cards, market history, or analytics price section available to your role. SRA Admins manage references through SRA Price Monitor on web and the publication action available on Android.

Product	Display unit	Read it as
Raw sugar	PHP/Lkg	Philippine pesos per 50-kilogram bag
Molasses	PHP/MT	Philippine pesos per metric ton

Check the reporting period and effective date. A blank or unquoted period is not a zero price. The application distinguishes Reported, No bidding, Milling ended, and Not reported. These are reference prices, not records of your individual sale proceeds.

11.2 SRA Admin: publish a price reference

1. Connect to the server and open the price-publication action.
2. Enter the Effective Date and Reporting Period.

3. Choose a status separately for raw sugar and molasses.
4. For a Reported product, enter a valid positive price in the correct unit. For an unavailable quote, use its status instead of entering zero.
5. Complete the circular/reference and issuing-authority/source details required by the form.
6. Review and select Publish Price Reference.
7. Wait for server confirmation and verify the saved entry in history.

11.3 Use operational analytics

Web: open Operational Analytics. Android: open Analytics from the relevant screen or dashboard.

1. Choose the available farm scope.
2. Select the Crop Year Cycle or reporting period.
3. Select All Fields or a particular Field independently of the year.
4. On Android, use Overview, Costs, Operations, and Market. These show crop progress, production costs, category breakdown, activity frequency, and price-reference information. On Web, use the corresponding analytics sections and filters.
5. Check filters and synchronization before comparing values between devices.

Production costs describe recorded operations; planner estimates describe intended work. A price reference alone does not establish farm income or profit. Cached analytics may be older than live data; inspect the snapshot time where shown.

On Android, the activity frequency ranking shows five activity types per page. Use Previous and Next to reach all standard and custom activities. Rank numbers continue across pages; activity shares and analytics totals use the complete filtered set. Changing the farm, field, Crop Year Cycle, or reporting period returns the ranking to the first page. Web keeps its full activity grid.

How analytics helps: crop progress identifies where fields are in the six-stage cycle; cost summaries show recorded spending; category breakdowns identify the main cost drivers; activity frequency shows repeated work; Market provides dated SRA reference prices. Use these to ask better follow-up questions and compare equivalent periods and field areas. The application does not forecast yield, guarantee profit, or prove work happened merely because an entry was submitted.

How to read the numbers: operation totals count eligible records, not the number of crop stages. A custom activity appears under its recorded operation name. A stage can have several operations. Activity share is the activity's record count divided by all eligible filtered records. Average operation cost is its total recorded cost divided by its record count.

Example: 5 Land Preparation records out of 30 total operations give about 17% after rounding. If those 5 entries cost PHP 5,000 in total, their average is PHP 1,000 per entry. Five activities shown on a page do not mean only five exist.

The labor/worker summary is not a count of unique people. In this release, it aggregates recorded worker-count values; inspect entry details before interpreting it as person-days. Cost-per-hectare values also depend on the area used by that card or comparison row. The System Guide explains these limits and worked examples.

12. Offline work and synchronization

12.1 What remains available

Task	Offline expectation
Farm Member field work	Supported plans, local drafts, operation capture, and stage changes can remain on the device for later submission
Farm Manager field work	Supported work on the manager's own assigned plot may remain local; acting on another owner's plot through Takeover requires a live connection
New field enrollment or cycle renewal	Requires an online server response
New sign-in, account recovery, or verification	Requires the server
SRA mobile reference viewing	Last account-scoped analytics and certified history can be read as timestamped cached data when available
Current audit QR lookup	Requires the server to retrieve the full report; Android can retain a scan for retry
SRA import, return, certification, publication, or crop-year compilation	Requires server confirmation; do not treat local viewing as an official action
Support creation	Supported local queues retain pending submissions for later delivery

Task	Offline expectation
Web Management Console	Online-only. A live server connection is required for access and submissions; stage changes and support tickets are never queued for automatic offline replay

Offline work depends on having previously signed in and loaded the authorized data. SRA cached views do not provide an offline pending-review queue or permission to certify.

The Web console blocks interaction when the internet connection or HUGPONG server is unavailable. Reconnect and choose Retry connection if needed. Forms already open can remain in memory, and saved form drafts may be retained, but this does not provide offline Web access or background submission. Browser queues saved by older releases are not automatically submitted or deleted; retain them for administrator review before clearing browser storage.

12.2 Read synchronization states

State	Meaning	What to do
Synced	Server accepted the change	Confirm the record details if needed
Unsynced	Change is stored locally and waiting	Restore connectivity and synchronize
Retrying	A retry is in progress or scheduled	Allow it to complete
Failed	Synchronization needs attention	Read the reason and resolve it
Conflict	The shared record changed or cannot accept this version	Review the current record with the responsible manager

An internet connection and a working HUGPONG server are separate requirements. No internet connection means the device cannot reach the network. HUGPONG server unavailable can appear even when other websites work.

12.3 Synchronize on Android

1. Reconnect to Wi-Fi or mobile data and let the server connection check finish.
2. If automatic synchronization is enabled, wait for the result.
3. If automatic synchronization is off or changes remain, open Sync Monitor and tap Sync Now.

4. Review the number processed, the remaining count, and the explanation for any failures or conflicts.
5. Resolve the stated issue, then retry the existing queued change.
6. Confirm that no relevant changes remain before compiling audits, changing devices, clearing storage, or signing out.

A retry can resume a saved change without creating a new record. Avoid creating another operation to work around a failed upload. For a conflict, compare the saved and current values with the Farm Manager before deciding how to correct the record.

12.4 Protect local work

If Android cannot read its saved queue, new saves and synchronization pause instead of replacing it with an empty queue. Sync Monitor shows the storage error and an unknown pending count. Retry Sync Now after the device can read storage again. Do not clear storage to resolve this error.

Normal application cache-version upgrades preserve pending queues and drafts. This does not protect against uninstalling the app, manually clearing its data, device loss, or a damaged device. Synchronize and check acceptance before changing phones.

Do not uninstall, clear app data, use Clear Local Cache, or clear browser storage while drafts or unsynchronized changes are still needed. These actions can remove local work. A phone's local queue is not a substitute for the central business-data backup.

If the application requires sign-in again, restore the authorized session and inspect the queue. Do not assume that seeing the same field name proves an earlier upload succeeded.

13. Profile, settings, and support

13.1 Profile and preferences

Web: open the account menu and Settings. Android: open Profile.

Review your User ID, name, role, registered number, and assignment. Use the permitted profile-edit controls for corrections. On Android, change the interface language from Profile. On web, choose the offered light, dark, or system theme preference.

13.2 Password and registered-number changes

1. Open Security or Security & Password.
2. For a password change, enter the current password, the new password, and its confirmation.
3. Select the offered session option: retain the current session or sign out all devices.

4. Submit online and follow the result. Other sessions are ended by a password change; sign in again where required.
5. For a registered-number change, authorize it with the current password and complete the verification workflow shown.

13.3 Ask for support

Farm Members, Farm Managers, and SRA Admins can create tickets. Super Admins handle them.

Web: use the account menu's support entry. Android: open Profile -> Help & Support Desk.

1. Choose New Ticket or Create Ticket.
2. Select a category: Account / Login; Synchronization; Field / Operation Data; Audit / QR; SRA Price; or Other.
3. Enter a short subject and a clear description of what happened.
4. Include relevant field, operation, report, or error-reference IDs and the approximate time. Never include your password or SMS code.
5. Submit once and check its state. On Android, Pending Submission means it is queued locally. Web requires an online server response and does not queue support tickets. Open means the server received the ticket.
6. Use My Tickets or the Active view to read replies and add a follow-up while the ticket is active.
7. Use History or Ticket History for resolved and closed tickets.

The ticket lifecycle is Open -> In Progress -> Resolved -> Closed. Requesters see their own tickets; the Super Admin manages handling and status changes.

13.4 Sign out

Check for drafts and unsynchronized work first. On web, open the account menu and choose Sign Out. On Android, use Profile -> Sign Out and choose Sync First when pending work is reported. Read the confirmation before continuing.

14. Super Admin: platform administration

Super Admin work is performed in the Web Management Console.

14.1 Accounts and roles

1. Open User Directory Monitor.
2. Locate the account and inspect its role, status, registered number, and assignments.

3. Use the permitted provision, edit, verification-review, recovery-review, or disable/reactivate action.
4. Check identity and intended access before saving a role or account-status change.
5. Review the saved result and relevant audit entry.

Account provisioning follows role-specific limits. For example, SRA Admins can provision permitted Farm Managers; Farm Managers provision scoped Farm Members. Do not assume a visible directory row is editable by every administrative role.

14.2 Support, monitoring, and diagnostics

- Support & Tickets Desk: open an active ticket, review the original request and conversation, add a response, and advance it through In Progress, Resolved, and Closed. The original subject and description are retained.
- System Sync Monitor: examine account/device connectivity, queued-work indicators, last activity, and successful sync information. Stale or unknown telemetry is not proof of successful synchronization.
- Maintenance & Security: inspect health summaries and the System Audit Ledger. Use the ledger's filters and paging to investigate recorded actions.
- Diagnostics Console: inspect sanitized error details and reference IDs to investigate reported failures.

Opening monitoring screens does not repair data. Match the account, field, report, and error reference before taking a corrective action.

14.3 Create and retain a backup

Create an encrypted business-data backup at least every 24 hours, after daily operations and before major changes.

1. Open Backup & Recovery and choose the create/download action.
2. Supply the required authorization and choose an archive passphrase of at least 16 characters. Use a passphrase separate from the account password.
3. Download the encrypted .hpbak archive.
4. Save two copies in separate locations.
5. Store the passphrase separately in a password manager.
6. Confirm that the activity entry shows READY or VERIFIED and record its reference.

14.4 Validate and recover

Run a recovery drill at least every 30 days and after changing the backup passphrase.

1. Select the intended .hpbak file.
2. Enter the current Super Admin password and the archive passphrase.
3. Select Run recovery drill.
4. Review checksum validation and the plan showing existing and missing records. A drill does not restore records.

For actual missing-record recovery:

1. Coordinate a pause in normal data entry and identify the affected records.
2. Validate the intended archive and review its date and recovery plan.
3. Only when the plan is correct, enter RECOVER MISSING RECORDS and run the recovery action.
4. Record the recovery reference and inspect the Audit Ledger.
5. Verify the affected records on both web and Android after refreshing/synchronizing.

Recovery recreates missing business records in the same project. It does not overwrite existing records or restore passwords, authentication identities, sessions, or every operational dataset. It is not a complete sign-in-system backup. Use the repository's Backup and Recovery Runbook for detailed operator procedures.

15. Troubleshooting

Problem	Checks and next action
Cannot sign in	Check User ID leading zeroes or registered number, password, connection, verification requirements, and whether the account supports this platform. Use password recovery when needed.
Account is temporarily locked	Follow the displayed wait instruction. Repeated retries and restarting do not reset the lockout.
SMS does not arrive	Check the registered number and resend timer. Use authorized review when offered, including the current Smart/TNT alternative.
No assigned field appears	Check filters and connection; ask the Farm Manager to verify the account-to-field assignment.

Problem	Checks and next action
A farm or manager ID appears instead of a name	The relationship may exist while its name is not loaded. Refresh/synchronize and confirm the assignment with the responsible administrator.
A selector has View all	It opens the full searchable list. An All Plots choice is a filter option and is not an additional physical plot.
Enrollment fails	Verify parent farm, owner, positive hectares, available farm area, and a live connection. Wait for the server-issued ID.
Field is locked for renewal	Ask the manager to review the pending cycle request and compile outstanding operations. The next cycle begins after approval.
Save says Unsynced	The change is local. Open Sync Monitor after reconnecting and inspect the remaining count.
Internet works but HUGPONG does not	Wait for the server-readiness check and its retry. Preserve local work and report persistent server unavailability.
Sync shows Failed or Conflict	Read the reason, restore permissions/session or correct invalid input as appropriate, and involve the Farm Manager for a shared-record conflict.
Operation cannot be edited	Check ownership, valid Takeover authorization, archival, and audit locks. Request an authorized correction.
Takeover authorization expired	Reconnect and authorize again using the manager's own password for the selected field.
Monthly audit cannot compile	Confirm assigned farm, valid period, eligible submitted operations, and synchronization of the relevant work. An existing report or no new eligible work may explain the result.
QR code will not resolve	Check that it is a HUGPONG audit code, use an unobstructed image, reconnect, and ensure the report reached the server. Retry retained scans or use the online report-ID lookup.
Audit disappeared from Inbox	Check its current status and Audit History. Certified reports leave the active review queue.

Problem	Checks and next action
Web and mobile totals differ	Align account scope, Field, Crop Year Cycle/period, active/ archive selection, and synchronization. Inspect cached snapshot time.
Price is unavailable	Read the quote status and period. No bidding, milling ended, or not reported does not mean a zero price.
Recovery approval expired	Start a new authorized recovery request; only the claimant can set the new password after approval.
Cannot find a submitted ticket	Check Pending Submission, Active, and Ticket History. Reconnect and refresh before creating another ticket.
Cannot close a dialog by tapping outside	Use its explicit Close, Cancel, or supported back control.

When escalating an issue, provide the affected User ID, device/app version, farm/field or report reference, time, visible message, and sync state. Keep passwords, OTP codes, and backup passphrases private.

16. Quick reference and glossary

Daily checklists

Farm Member: verify field and stage; record actual work and costs; check the ledger; synchronize pending changes; preserve drafts before signing out.

Farm Manager: check member activity and synchronization; confirm assignments; resolve eligible corrections and cycle requests; compile outstanding monthly work; check delivery and return reasons.

SRA Admin: review the live Audit Inbox; verify report contents; certify or return with a reason; check price periods; export certified records when needed.

Super Admin: review support and health; investigate errors with reference IDs; maintain account access; download the daily backup; keep two copies; schedule the recovery drill.

Glossary

Term	Meaning
Block Farm	A managed group of sugarcane fields

Term	Meaning
Field / Field Plot	An individual agricultural area with an owner assignment and crop-cycle records
Crop Year Cycle	The annual production-cycle identity, displayed in a form such as 2026-2027
Current Stage	The field's current position in the six-stage crop workflow
Draft	Local, unsubmitted operation preparation
Outbox	Saved changes waiting to be sent to and accepted by the server
Operation Date	The date work was performed, separate from the time it was entered
Manager Takeover	Time-limited authorization for a manager to act on another owner's field
Supplemental	Additional recorded work for an activity
Amendment	A correction with a retained reason, actor, and change history
Audit snapshot	The report's preserved set of operation values and supporting details
QR reference	A scannable report identity and integrity reference used to retrieve the official report
Certified reports to date	The certified monthly sources included in a crop-year compilation at its creation
ha	Hectares
Lkg	A 50-kilogram sugar bag
MT	Metric ton, equivalent to 1,000 kilograms
PHP	Philippine peso

Document control

This edition covers the deployed Beta 1.0.8 application and repository workflows reviewed on 28 October 2026. It includes online-only Web access, durable Mobile queues, paged activity rankings, current audit-readiness behavior, canonical assignment labels, and the recent UI/UX finalization. Buttons may differ by role, assignment, language, connection, and later app version.

The NACAYAO beta demonstration batch contains one test manager and five test members with five plots. Sample operations are test data; published SRA price references are separate real data. Test phone profiles are not verified personal contacts and are not suitable for an SMS-delivery test. Obtain test credentials privately from the beta coordinator; passwords are intentionally not printed in this manual. Never reuse a demonstration account as a permanent real-person account without the authorized replacement process.

Document changes require no database/schema, Server/API, Web, or Mobile code changes. This manual describes both clients' existing behavior and preserves the server as the authority for official actions. Signed-in workflows, device installation, accessibility rendering, and offline recovery still require beta acceptance; automated tests are not proof that every device scenario has passed.
